Introduction

We are pleased to submit this technical report to the Making Electoral Democracy Work team. Harris/Decima assembled a team of seasoned researchers from our Public Affairs team to work on this project. Their roles were as follows:

- Doug Anderson served as the Senior Project Manager. Mr. Anderson was responsible for overall project direction and ensuring the contractual obligations were met. He directed the project team, ensured quality control throughout the life cycle of the project and reviewed final deliverables.
- Danielle Armengaud served as Lead Consultant and the project analyst overseeing the day-to-day management of the project, managing field, suppliers and sampling. Furthermore, Ms. Armengaud was the main point of client contact during the project.

About Making Electoral Democracy Work

The Social Sciences and Humanities Research Council of Canada has awarded a significant grant for a seven-year research project entitled *Making Electoral Democracy Work (MEDW)* to Professor André Blais of the University of Montreal (Principal Investigator) and an international team of researchers.

This project brings together an exceptional team of economists, political scientists and psychologists from Canada, Europe, and the United States to undertake the most ambitious study ever undertaken on the impact of electoral rules on the functioning of democracy. The project will examine 26 elections in five countries.

The goal of the project is to examine the determinants of vote choice (including decision to vote or not to vote) in different election contexts.

Swiss Cantonal Elections Surveys – Zürich and Lucerne

The MEDW Team sought the services of a public opinion research firm to collect online data from residents in Zürich and Lucerne, Switzerland through surveys related to the cantonal elections held on April 3, 2011 (Zürich) and April 10 (Lucerne). This study included a pre- and post election survey implemented through a return to sample methodology.

Harris/Decima completed 1191 and 1202 pre-election surveys and 844 and 907 post-election surveys online in Zurich and Lucerne, respectively.

This report presents a detailed description of the survey methodology used to complete this research, including sample design, recruitment, survey administration, response rates, weighting and recommendations for the future. This document contains all the details necessary to replicate this study in the future.

Number of Completed Surveys

Harris/Decima completed the following number of surveys, seen in the table below.

	Dates	Total # qualified completes
Zürich		
Pre-election survey	March 24–April 2, 2011	1191
Post-election survey	April 4–9, 2011	844
Lucerne		
Pre-election survey	March 31–April 9, 2011	1202
Post-election survey	April 12 ¹ – April 19, 2011	907

These total numbers of completes exclude respondents who failed two or more In-Survey Quality (ISQ) Measures but includes respondents who failed only one. For more information, please see the section describing *In-Survey Quality Measures*.

¹ The Monday after the Lucerne election (April 11, 2011) was a statutory holiday in Switzerland; therefore, surveying did not commence until Tuesday, April 12.

Survey Methodology

Pre-launch

Questionnaire Design – CAWI

The MEDW team was responsible for providing the English and German versions of the pre and post election survey questionnaire.

Harris/Decima provided limited consultation on the questionnaire design to facilitate online survey administration. This survey was fielded in German and all translation of the survey instruments were provided by the MEDW team.

Programming

Once the survey was finalized, it was programmed by Harris/Decima's in-house programming team. Harris/Decima uses the *Confirmit Horizons Platform* software for data collection in online surveys. *Confirmit* includes support for random respondent selection, respondent identity verification via passwords (numeric passwords up to 12 digits) and for quota control. It also features adaptive questionnaire logic designed to provide many of the same methodological safeguards associated with traditional CATI telephone interviewing (i.e., randomized ordering of variables being tested in a battery, skip patterns based on responses given). The package allows the project manager to track non-responses to survey requests and provides estimates of non-response bias.

Survey Pre-Tests

Prior to being finalized, the online surveys were pre-tested or slow started with approximately 20 respondents. After the slow start, Harris/Decima analysts checked all of the frequencies and skip logic to ensure it elicited the required information, before launching the full survey the following day.

Sample Design and Selection

The sample for this survey was designed to yield 1,000 complete pre-election survey interviews and a return-to-sample target of 750 interviews from the post-election survey. A stratified, quota-based sampling approach was used, since this generates substantive estimates across and within specific key segments of interest, which in turn permits extrapolation to the broader population with greater confidence. Quotas were set by controlling for age, gender and education status.

Based on census statistics², the following demographic quotas were set for the pre-election surveys:

Canton Zürich:

	Gender					
	Total - %	Total - Quota	Male - % of population	Male - Quota	Female - % of Population	Female - Quota
Total	100%	1000	49%	486	51%	514
Age						
18 - 34 years	28%	285	14%	143	14%	142
35 - 54 years	39%	388	20%	195	19%	191
55 - 99 years	33%	327	15%	148	18%	181

		% of Population	Quota
Education ³	Lower education: No formal education, Obligatorische Schule (Primar-, Real-, Sekundar-, Bezirks-Orientierungsschule, Pro-, Untergymnasium, Sonderschule)	11%	108
	Middle education: Diplommittelschule (bis 2 Jahre), Verkehrsschule, Sozialjahr, Vorkurs für Pflegeberufe (1/2 Jahre), berufsvorbereitende Schule, Anlehre, Berufslehre oder Vollzeit-Berufsschule (z.B. Handelsschule, Lehrwerkstätte)	50%	499
	Higher education: Maturitätsschule, Berufsmatura, Diplommittelschule (3 Jahre), Lehrkräfte-Seminarien (z.B. Kindergarten, Primarschule, Fachlehrkräfte), Höhere Fach- und Berufsausbildung (z.B. eidg. Fachausweis, eidg. Fach-, Meisterdiplom, Höhere Kaufmännische Gesamtschule HKG, Techniker TS), Höhere FachSCHULE (z.B. HTL, HWV, HFG,	39%	393

² Source: MACH Basic 10 study, Undertaken by LINK; the largest media usage study in Switzerland, based on approx. 20,000 interviews per year, latest data from 2010. Weighted according to latest census (Statistik des jährlichen Bevölkerungsstandes (ESPOP), 1981-2009).

³ Education quotas were set as “soft quotas” and not nested with age and/or gender.

	HFS), bei Vollzeitausbildung mit Mindestdauer von 3 Jahren (inkl. Nachdiplom), Universität, Fachhochschule, Hochschule (inkl. Nachdiplom)		
--	---	--	--

Canton Lucerne:

	Gender					
	Total - %	Total - Quota	Male – % of population	Male – Quota	Female – % of Population	Female – Quota
Total	100%	1000	49%	488	51%	512
Age						
18 - 34 years	30%	298	15%	147	15%	150
35 - 54 years	39%	395	21%	206	19%	190
55 - 99 years	41%	307	13%	135	17%	172

		% of Population	Quota
Education ⁴	Lower education	14%	141
	Middle education	53%	529
	Higher education	33%	330

Given that the post-election survey was a return to sample only, no quotas were set for this portion of this study.

Survey Administration

Supplier Panel Information

Harris/Decima contracted The LINK Institut (LINK: <http://www.link.ch/>) as a sample provider for this study. For detailed descriptions of LINK's panel, including company profile, panel recruitment, panel and sample management, policies and compliance, partnerships and multiple panel membership information and data quality and validation, please see Appendix B.

Sampling and Quota Control

Quotas were monitored daily by the Harris/Decima project manager and by the project team using a monitoring tool supplied by the Conformat survey platform ("Reportal"). Sample pulls and reminders were based on quota needs.

⁴ Education quotas were set as "soft quotas" and not nested with age and/or gender.

Sample was pulled by LINK on March 22, 2011 for the Zürich study and on March 29 for the Lucerne study.

Sample was pulled based on the following criteria:

- Age greater than 18
- Language set to German
- Area set to Zürich/Lucerne
- Education levels
- Gender
- Swiss citizenship

For the post-election surveys, no further sample was pulled – invites and reminders were sent only to those who completed the pre-election survey.

Invites and Reminders

To complete the online survey, respondents were sent an invitation and clicked on a survey URL with an embedded password to be redirected to the Harris/Decima site where the survey was hosted. The survey included an information and consent form which provided information about the study, encouraged their participation, provided them with the necessary privacy information and reiterated that by clicking “Weiter” (German translation of ‘next’) on the survey they consented to participation.

The survey was accessible 24 hours a day, seven days a week from any web-enabled computer.

Reminders were sent periodically to those who had not yet completed the survey.

Invites and reminders were sent by LINK as follows:

	Date	# Invites	# Reminders
Zürich			
Pre-election survey	Thursday, March 24, 2011	350	
	Friday, March 25, 2011	1676	
	Tuesday, March 29, 2011	1509	1039
	Friday, April 1, 2011		221
Total		3535	1260
Post-election survey	Monday April 4, 2011	267	
	Tuesday April 5, 2011	918	
	Friday April 8, 2011		349
Total		1185	349
Lucerne			
Pre-election survey	Thursday, March 31, 2011	297	
	Friday, April 1, 2011	2659	

	Thursday, April 7, 2011	409	
	Friday, April 8, 2011	709	810
Total		4074	810
Post-election survey	Tuesday April 12, 2011	264	
	Wednesday April 13, 2011	940	
	Friday April 15, 2011		387
	Tuesday April 19, 2011		202
Total		1204	589

Incentives

As is customary with all online panel surveys, participants were provided with an incentive upon the completion of the survey.

Respondents were given the choice of the following incentives for the pre-election survey:

- phone vouchers which allow you to call landlines in Switzerland for free for 60 minutes
- credit for your Manor Card
- 200 Coop super-points
- 200 Migros cumulus-points
- Voucher(s) for buch.ch
- A donation for one of 3 suggested charities

And for the post-election survey:

- phone vouchers which allow you to call landlines in Switzerland for free for 60 minutes
- credit for your Manor Card
- 150 Coop super-points
- 150 Migros cumulus-points
- Voucher(s) for buch.ch
- A donation for one of 3 suggested charities

Passwords

Harris/Decima provided LINK with a generic link so that when respondents came into the survey their password was appended to the end of the URL. Cookies were enabled to control access to the survey so respondents could only complete the survey once.

Sample Distribution and Response Rate

The table below presents the overall participation rate for the pre-election and post-election surveys:

	Zürich		Lucerne	
	Pre	Post	Pre	Post
A: Total Invitations	3535	1185	4047	1204
B: Undeliverables ⁵	3	0	3	0
C: Net Usable invitations (A-B)	3532	1185	4044	1204
D: Total Completes	1192	844	1205	908
E: Qualified break offs	344	49	277	42
F: Disqualified (ISQ)	1	0	3	1
G: Not responded	1916	292	2332	253
H: Quota filled	79	0	227	0
Contact Rate (d+e+f+h)/c	46%	77%	42%	79%
Participation Rate (d+f+h)/c	36%	71%	35%	75%

As a point of reference, LINK experiences an average response rate of 55% in Switzerland across all projects. All surveys are different and response rates do vary from project to project. In general, political surveys tend to have a lower response rate because they may ask for sensitive information on voting habits. As well, interest in politics and the length of this particular survey may have played a role in lower response rates.

Average lengths, once outliers were removed, were:

- Zürich pre-election survey: 30 minutes
- Zürich post-election survey: 14 minutes
- Lucerne pre-election survey: 25 minutes
- Lucerne post-election survey: 14 minutes

The following table indicates how many completes were achieved each day. For a more detailed breakdown of these numbers by quota please see Appendix A.

⁵ These are estimations. LINK panelists with undeliverable email addresses are set to “inactive” and called by phone for correction of e-mail address. Number of undeliverables for this study is therefore negligible.

Completions by Date: Pre and Post Wave

In-Survey Quality Assurance (ISQ)

Harris Interactive uses a multi-layered approach to ensure that fraudulent respondents, those who intentionally misrepresent themselves by providing inaccurate information, and/or those who misrepresent themselves as more than one individual by joining a panel under multiple email addresses, are detected and removed and do not affect client results.

As this study was conducted with LINK's Swiss panel, which has been proven to be a very high-quality panel, we relied on our In-Survey Quality Assurance measures to ensure an extra "check" for bad respondents.

Respondents generally enter our surveys intending to participate as thoughtfully as we desire, but occasionally some will be pressed for time or will find a survey excessively long or burdensome. In those situations, some respondents may "speed" to complete the survey quickly.

In an effort to identify respondents who are speeding or appear unengaged in the survey, we have developed a series of ISQ metrics. They consist of the following:

- Minimum Length of Interview
- Incorrect response to respondent instruction
- Identification of straight-lining activity at a grid question
- Less than 5 characters at a mandatory open-ended response
- Illogical responses to survey questions

For this survey, the first three of these five metrics were utilized:

- Minimum length of interview for the pre-election study was set at 8 minutes and for the post-election study, at 2 minutes
- The respondent instruction question added early in the questionnaire was as follows:
"To ensure that your browser is downloading the content of this survey properly, please select the number four below."
 - One (1)
 - Two (2)
 - Three (3)
 - Four (4)
 - Five (5)
 - Don't know (9)
- Respondents giving the same answer for all questions in the Q28 (pre-election) and PQ26 (post-election) batteries were flagged as "straightliners."

A respondent was disqualified if they "failed" two or more of these measures.

Data Analysis

Upon completion of data collection, Harris/Decima cleaned and weighted the data.

Data Validity and Integrity Checks

Our custom system immediately identifies cases where the interview length is unrealistically short, contradicts established facts or presents patterns of response deserving attention. As a result, we can determine whether a case should be excluded from the final sample if necessary. All of these checks are preformed manually and cleaned out of the data in the back end of the project. Harris/Decima uses a checklist to ensure all data that is delivered to the client has gone through a rigorous quality control process. During this time Harris/Decima also cross referenced all IDs between the pre and post surveys to ensure all responses were valid. A few test cases were removed from the data. As well, postal code information was removed to preserve anonymity of participants. The postal code variable (SD2AE1) appears in the datafile but does not contain any data.

Data Cleaning

Harris/Decima analysts have considerable experience in cleaning data files, conducting statistical routines, producing tabular output, and weighting data to provide an accurate measure of the population as a whole.

The following are the basic steps taken when cleaning data files:

- Ensure that all coded questions have updated codes and multiple mentions do not have duplicate codes;
- Create all new variables as a result of programming;
- Confirm that all relevant variables are included in the data file;
- Final frequency check (for out-of-range values) and recodes created, including those for outliers;
- Verify that variable names and question numbers match the final version of the questionnaire; and
- Create and verify new variable creations (against source variables) as outlined in the analysis plan and perform spell check on all variables.

In addition to these generic rules, project specific requirements are also taken into account. It is also noteworthy that because the CAWI software controls the questionnaire flow and data entry, data are typically quite clean from the outset.

Additional Variables Created

Harris/Decima created a number of extra variables to assist the MEDW team in navigating and analyzing the data:

Time Stamps (Variables tim000 to tim129): The way that timing variables work in this study is that they each capture how long the survey has taken (in seconds) at the point the respondent crosses the variable. To analyze how long someone has taken between two timestamps, subtract the first time stamp variable from the second and this will represent how long it took the respondent to get from the first variable to the second. In order to convert to minutes, divide the outcome by 60.

Time variable (Q134): Q134 is a system variable (created by the survey software) that shows the time (in seconds) that each participant was online in the surveys. The number of seconds includes both that spent in the pre-election and in the post-election study and is cumulative. This variable can therefore not be used to calculate the average length of the two surveys individually.

Flags: Four instances were found where respondents were possibly exposed to programming errors in the survey. This may have affected a few survey responses. As such, they were flagged in the data:

- **Flag1 (Zürich):** Flags those who completed the Zürich pre-election survey between 2:50 PM and 5:05 PM on Friday, March 25, who answered Q6a3 and/or Q8c4. These respondents were shown the wrong choicelist of parties in these questions.
- **Flag2 (Zürich):** Indicates a potential non-logic in the survey. Flags those who answered Q6b1_1 = 1 (Ja) and Q6b1_3 = 2 (Nein) for Zürich pre-election study as “illogic at Q6b1_1 and Q6b1_3.”
- **Flag3 (Zürich):** Indicates a potential non-logic in the survey. Flags those who answered pQ6b1_1 = 1 (Ja) and pQ6b1_3 = 2 (Nein) for Zürich post-election study as “illogic at pQ6b1_1 and pQ6b1_3.”
- **Flag (Lucerne):** Indicates a potential non-logic in the survey. Flags those who answered Q6b1_1 = 1 (Ja) and Q6b1_3 = 2 (Nein) for Lucerne pre-election study as “illogic at Q6b1_1 and Q6b1_3.”

Section: The section variable aides in selecting the appropriate respondent group for analysis:

Value	Label	Segment
1	Pre-election complete	Those who only completed the pre-election survey
2	Pre-election incomplete	Those who started but did not complete the pre-election survey
3 (empty)	Post-election complete	Those who only completed the post-election survey
4	Post-election incomplete	Those who started but did not complete the

(empty)		post-election survey and who did not complete the pre-election survey
5	Pre and post election complete	Those who completed both surveys
6	Pre complete and post incomplete	Those who completed the pre-election survey and started the post-election survey, but did not complete it
7 (empty)	Pre incomplete and post complete	Those who started but did not complete the pre-election survey and completed the post-election survey
8	Neither section started	Those who dropped out of the survey in the screening section before Q1

This variable can be recoded to select appropriate respondent groups for analysis. For example, (1 + 5 + 6) are all those who completed the pre-election survey.

Last question answered (lastq): indicates the last question an “incomplete” respondent answered before dropping out of the survey.

ISQ fail variables: Ten variables were created to indicate how respondents did on the in-survey-quality measures. As discussed, it is recommended to only exclude those who failed two or three of the measures. The two variables (one for the pre-election survey and one for the post-election survey) that can be used to filter for those respondents are bolded in the table below.

Variable	Segment	Pre or post survey
pre_grid	Straight line grid isq fail.	Pre
pre_resp	Respondent instruction isq fail	Pre
pre_time	Minimum length of survey isq fail	Pre
pre_fail	Failed one or more isq measures	Pre
Pre_fail2	Identifies those who failed 0, 1, 2 or 3 isq measures	Pre
post_grid	Straight line grid isq fail.	Post
post_resp	Respondent instruction isq fail	Post
post_time	Minimum length of survey isq fail	Post
post_fail	Failed one or more isq measures	Post
Post_fail2	Identifies those who failed 0, 1, 2 or 3 isq measures	Post

Electoral Constituency (elec_con): In the final data set, Harris/Decima appended all the electoral constituency information, based on postal codes provided by the respondents (variable SD2EA1) and information provided by MEDW.

Q1 and PQ1 combined variables (q1a1_all, q1a2_all, q1a3_all, q1a4_all, pq1a1_all, pq1a2_all, pq1a3_all and pq1a4_all): The Q1 and PQ1 batteries were split sample questions, meaning that half the sample received those questions at the beginning of the surveys and the other half at the end. These variables combine the answers from those two split samples for a base_all variable for each question in the battery.

Date variables: Two date variables were created; one for the pre-election study (**pre_end**) and one for the post-election study (**post_end**). These are the dates (day and month) that participants completed or otherwise exited (i.e. dropped out of) the survey.

Collapsed Age variable (age1): This variable collapses the respondents' ages into three categories (18-34; 35-54 and 55+), which is used for weighting purposes.

Collapsed Education variable (sd2a_w): This variable collapses the respondents' education level into three categories (low, middle and high – for details, please see section on quotas), which is used for weighting purposes.

Age by Gender (Age_gend): Collapsed age variable by gender, used to create weights.

Education by Gender (Educ_gend): Collapsed education variable by gender, used to create weights.

Collapsed vote variable (Vote_col): Created from Vote variable (provided by MEDW), used to create weights.

Likelihood to vote (Pre_int): Created from Q6 and Q7 variables in order to identify who is likely to vote, used to create weights. Q6=1 OR ANY (Q7, 1, 2,3) = Yes; all else is no.

Likelihood of having voted (Post_int): Created from PQ5_1 and PQ5_2 variables in order to identify who is likely to have voted, used to create weights. PQ5_1=4 OR PQ5_2=1 = Yes; all else is no.

Weighting

At the conclusion of the data collection and cleaning, Harris/Decima weighted the data by each quota stratum to reflect the actual proportions found in the population. This ensures the findings from the research can be extrapolated to the entire population with accuracy.

RIM weighting (Random Iterative Method - also called raking) was used to create weights. This method of weighting puts selected non-interlocking and grouped interlocking variables in isolation through an iterative sequence of weighting adjustments. The sequence adjusts for each rim in turn and then repeats itself as many times as is required in order to obtain a convergence, in which the sum of the weighted rims matches the target population estimates, or is as close as it is possible to achieve. The number of iterations is indicated in the table below.

The data used for the demographic weights were taken from the same sources as used for the quotas. The source of the official turnout and statistics were supplied to Harris/Decima by the MEDW team.

As a matter of convention, the average weight was set to 1 so that the unweighted base is the same as the weighted base.

Although weighting caps were set, these caps are not hard, but were instead capped by trimming and then after normalization the range in some instances moved slightly.

Full weight reports can be found appended to this report.

The datafile includes the following weights:

Name	Factors	Use for Pre/Post	# iterations – Zürich	# iterations – Lucerne	Cap - low	Cap - high
PRE_WEIGHT1	age, gender, education	Pre	20	20	0.2	5
PRE_WEIGHT2	age, gender, education and likelihood to vote (vote turnout)	Pre	20	20	0.2	5
PRE_WEIGHT3	age, gender, education, likelihood to vote (vote turnout) and vote intention (actual election results). Note, non-voters were weighted to 64.5% in PRE_VOTE	Pre	20	20	0.2	5
PRE_WEIGHT3B ⁶	age, gender, education and vote intention (actual election results)	Pre	20	20	0.2	5

⁶ Weights 3 and 3B are used to create weights that account, in addition to demographic attributes, for a respondent's likelihood to vote (whether they intend to vote at the time of the pre-election survey or whether they have voted at the time of the post-election survey) and whom they intend to vote for (in the pre-election survey) or who they have voted for (in the post-election survey). Weight 3 does this by using a separate rim for likelihood to vote and vote intent. Weight 3B, however, combines a respondent's likelihood and intent into a single rim by adding the code 'Non-voter' to the VOTE_COL variable and then setting the weight target for those respondents to the non-voter target based on election results while the vote intent targets are set based on election results multiplied by voter turnout. This method avoids voters being weighted up in the vote intent rim and then weighted down (equally) in the likelihood to vote rim, as each party's vote intent targets are only based on actual voter turnout.

PRE_WEIGHT4	age, gender, education and vote intention (actual election results)	Post	20	20	0.2	5
POST_WEIGHT1	age, gender, education	Post	4	20	0.2	5
POST_WEIGHT2	age, gender, education and likelihood to vote (vote turnout)	Post	7	20	0.2	5
POST_WEIGHT3	age, gender, education, likelihood to vote (vote turnout) and vote intention (actual election results)	Post	20	20	0.2	5
POST_WEIGHT3B	age, gender, education and vote intention (actual election results). Note, non-voters were weighted to 64.5% in PRE_VOTE ⁶	Post	7	20	0.2	5
POST_WEIGHT4	age, gender, education and vote intention (actual election results)	Post	5	20	0.2	5

Appendix B: Supplier Panel Information

LINK

Panel Information

- 1) What is the size of your panel in each of the following regions and countries:
 - a. Switzerland: Lucerne and Zurich

panelists who are eligible voters

Lucerne: 5'400, Zurich: 17'100

- 2) What panel recruitment techniques do you currently employ?
 - a. Please describe your recruitment sources.

100% CATI recruited from nationally representative surveys; no self sampling, no snowball system; no double entry

- 3) Describe your panel quality control process(es).

Careful recruiting (100% CATI), Multiple validation checks during the survey. Data mining (fraud protection).

Response rates are monitored. Panelists with low response rates (<20%) are excluded from the panel.

Quality of interviews is tracked by control questions (consistency), answer patterns and length of interviews. Panelists with bad quality and/or fraudulent respondents are excluded from the panel.

Panel management: we reply personally within 24 hours (during working days) on any questions from our panelists; if an Email address is no longer valid, each panelist gets contacted by phone to be asked for the new address.

Sampling done by experienced project managers.

- 4) What panel profiling information, demographic or otherwise, is available?
 - a. How are your panelists profiled?

profiling questionnaire at opt-in and update questionnaires

- b. How often are your panelists profiled?

invitation to update questionnaire once a year

- c. What information is included in your profiling surveys?

Sociodemographic variables as well as hundreds of other data (consumer behaviour etc.)

- d. What questions are mandatory and optional in the profiling survey?

all questions are mandatory, "no answer" option for sensitive questions

- 5) How will you confirm geographic residency of participant?
Geographic residency is updated once a year in the update questionnaire. We recommend to ask geographic residency in the screener as well.

- 6) What will your approach be should there be challenges in meeting the required quotas?

We estimate feasibility carefully. If there should be challenges all the same, we suggest to extend the field time and/or open up adjacent quota cells.

Sample

- 1) How is sample pulled?

Within the quota cells at random (or complete survey if necessary)

- 2) What sample sources do you use?

our own LINK Internet Panel

- 3) How is your sample composed?

100% LINK Internet Panel

- 4) How will you ensure demographic quotas and representativeness is met to the aforementioned standards in this study?

Sampling done and controlled by experienced project managers

Paradata

- 1) What para-data will be available for this study?
 - a. Census information? **yes**
 - b. Electoral district? **yes**
 - c. Age? **yes**
 - d. Gender? **yes**
 - e. Region? **yes**
 - f. Sub-region? **yes**
 - g. Education? **yes**
 - h. Any other relevant information? **yes, other sociodemographic information, e.g. Income, urban/rural, ...**

Passwords

- 1) How does your company typically employ passwords in internet surveys?
embedded in unique links
- 2) Are you capable of embedding passwords in unique links provided by Harris/Decima to ensure controlled access to the survey? **yes**

Non-Response Information

- 1) Please indicate if your firm is capable of providing the non-response information on page 4. **yes**

Response Rates

- 1) Please indicate the anticipated response rate for the following:
 - a. The Pre Test **50-55%, if minimum 10 days of field**
 - b. The Post Test **75-85%, if minimum 10 days of field**

Incentives

- 1) What is your standard incentive structure?

Incentives for all respondents are a choice of: prepaid codes for phone calls (provider independent), participation in the 2 biggest retail bonus programs offered in Switzerland (covering >80% of the population), vouchers for online book stores, donation. Incentives vary with the length of the questionnaire along 5 minute-steps.

- 2) Can your incentive structure be customized for this project? **yes**
- 3) What incentive structure do you recommend for this project?

same as 1)

Panel Usage

- 1) What is the average number of surveys sent to a panelist per month?

About 1 invitation per month

- 2) What types of surveys (academic, commercial, government) do you usually send to your clients?

all types, most surveys are commercial surveys

- 3) Do you have procedures for cleaning your panel of non-responsive panelists?

exclusion of panelists who respond to less than 20% of invitations

Challenges

- 1) Please briefly describe any challenges you foresee in completing this research and your firms proposed solutions.

Feasibility of detailed quotas for the second wave in Lucerne. Solution: re-invitation of panelists who participated in the first wave

Appendix C: Invitation E-mail and Information and Consent Screen

Invitation

Pre-election survey:

Guten Tag «first name» «last name»

Wir laden Sie herzlich zu unserer aktuellen Umfrage ein.

Klicken Sie bitte auf den folgenden Link, um zum Fragebogen zu gelangen:

[ZUM FRAGEBOGEN](#)

Wenn Sie nach wenigen Fragen zu den von uns gesuchten Personen gehören, dauert das Ausfüllen des Fragebogens etwa 20 Minuten. In diesem Fall können Sie am Ende des Fragebogens Ihre Prämie aus 6 Angeboten auswählen:

- Telefongutscheine, mit denen Sie insgesamt 60 Minuten gratis auf dem Festnetz in der Schweiz telefonieren können
- Gutschrift auf Ihre Manor Karte
- 200 Coop Superpunkte
- 200 Migros CUMULUS-Punkte
- Gutschein(e) von buch.ch
- eine Spende für eines von 3 vorgeschlagenen Hilfswerken

Falls Sie Zugangsprobleme oder technische Fragen haben, antworten Sie bitte auf diese Email (panel@link.ch).

Mit freundlichen Grüßen

LINK Institut für Markt- und Sozialforschung

Stefanie Nater

Post-election survey:

Landing Page:

Vielen Dank, dass Sie sich entschlossen haben an unserer Umfrage teilzunehmen. Wir führen eine Forschungsstudie zum Thema Wahlen und Demokratie durch und würden gerne Ihre Meinung erfahren. Die Teilnahme an der Studie ist freiwillig, Ihre Angaben werden absolut vertraulich behandelt und nur zu wissenschaftlichen Forschungszwecken verwendet. Sie müssen 18 Jahre alt, Schweizer Staatsbürger und im Kanton ZH stimmberechtigt sein, um teilnehmen zu können.

Die Studie besteht aus zwei Teilen. Wir bitten Sie heute, den ersten Teil auszufüllen. Dies ist eine Umfrage, die ca. 20 Minuten in Anspruch nehmen wird. Beim zweiten Teil handelt es sich um eine weitere, aber kürzere Umfrage. Wenn Sie heute an der Umfrage teilnehmen, werden wir Sie zu einem späteren Zeitpunkt wieder kontaktieren und um die Beantwortung des zweiten Fragebogens bitten. Auch die Teilnahme an diesem zweiten Teil ist freiwillig.

Wenn Sie weitere Zusatzinformationen über die Studie lesen möchten, dann klicken Sie bitte [HIER](#).

Wenn Sie mit der Umfrage beginnen möchten, ohne die Zusatzinformationen zu lesen, dann klicken Sie bitte auf den grünen Pfeil rechts unten (weiter). Mit Beendigung der Umfrage willigen Sie in die Teilnahme an der Studie ein.

Wenn Sie zu irgendeinem Zeitpunkt Fragen zur Studie, zur Art der Durchführung oder zu Ihren Rechten als Forschungsteilnehmer haben, kontaktieren Sie bitte eine der Personen, die in der [ZUSATZINFORMATION](#) aufgeführt sind.

Verwenden Sie während der Umfrage bitte nicht die Browser-Schaltflächen *VORWÄRTS* und *ZURÜCK*, sondern immer die Schaltflächen unten, um durch die Umfrage zu navigieren.

Klicken Sie einfach auf den Vorwärts-Pfeil am Seitenende, um mit der Umfrage zu beginnen.

Additional Information:

Der Zweck dieser Seite ist es, Sie über die Einzelheiten unserer Studie zu informieren. Sie müssen 18 Jahre alt, Schweizer Staatsbürger und im Kanton ZH stimmberechtigt sein, um teilnehmen zu können.

Der Zweck dieser Studie ist die Erfassung von Informationen über Ihre Einstellungen und Meinungen zu Wahlen und Demokratie. Die Teilnahme an dieser Studie ist freiwillig. Sie können sich jederzeit weigern, daran teilzunehmen und sie können die Umfrage jederzeit abbrechen.

Die Studie besteht aus zwei Teilen. Den ersten können Sie heute abschliessen, was ca. 20 Minuten in Anspruch nehmen wird. Der zweite Teil wird nach dem 3. April 2011 verschickt. Wenn Sie die heutige Befragung beenden, werden wir Sie erneut anschreiben und Sie bitten, auch an der zweiten Umfrage teilzunehmen. Eine heutige Teilnahme verpflichtet Sie aber keinesfalls zur Teilnahme an der zweiten Umfrage.

Der Nutzen dieser Studie liegt darin, dass Ihre Antworten dabei helfen werden, unser Verständnis von Wahlen in Zürich zu verbessern.

Wenn Sie die heutige Umfrage abschliessen, können Sie am Ende des Fragebogens Ihre Prämie aus 6 Angeboten auswählen :

- Telefongutscheine, mit denen Sie insgesamt 60 Minuten gratis auf dem Festnetz in der Schweiz telefonieren können
- Gutschrift auf Ihre Manor Karte
- 200 Coop Superpunkte
- 200 Migros CUMULUS-Punkte
- Gutschein(e) von buch.ch
- eine Spende für eines von 3 vorgeschlagenen Hilfswerken

Sollten Sie auch die zweite Umfrage abschliessen, werden sie auch entschädigt.

Ihre Angaben werden zu jeder Zeit streng vertraulich behandelt.

Falls Sie zu irgendeinem Zeitpunkt Fragen zu dieser Studie haben, können Sie folgende Personen kontaktieren:

Marian Bohl, M.A./Prof. Dr. Hanspeter Kriesi Institut für Politikwissenschaft der Universität Zürich
Affolternstrasse 56
8050 Zürich
Tel: 0041 44 634 3979
E-Mail: marian.bohl@ipz.uzh.ch

Dr. Laura Stephenson
Department of Political Science
University of Western Ontario
London, Ontario, Kanada
Email: lstephe8@uwo.ca

Wenn Sie weitere Fragen zur Durchführung diese Studie oder Ihren Rechten als Forschungsteilnehmer haben, können Sie zudem kontaktieren:

Büro für Forschungsethik,

University of Western Ontario (Englisch)

Tel: 00-1-519-661-3036

Mit Beendigung der Umfrage erklären Sie Ihre Zustimmung zur Teilnahme an der Studie.

Wenn Sie an der Studie teilnehmen möchten, schliessen Sie bitte dieses Browserfenster und klicken Sie den vorwärts-Pfeil rechts unten um mit der Umfrage zu beginnen.

WEIGHTING REPORT - PSTWGT4
- POST_WEIGHT4 -

RIM weighting: age_gend, educ_gend, vote_col

Overall RIM Weighting Efficiency: 81.12%
Number of iterations performed: 20

Input count of respondents: 907

Respondent weight limits specified for this group: min. 0.00000000 - max. 907.00000000
